

Quiz 6

OBSERVER DESIGN PATTERN

Scenario:

Create an application for a stock market day trader. As the stock price changes you will use the observer design pattern to give updates on the new price.

- 1) Create a Class called **Stock** that will have a method that accepts an Observer and to allow it to be notified when the stock price changes
- 2) The Observer interface is given as:

```
interface Observer {  
    void update(String symbol, double price);  
}
```

- 3) Implement the Observer interface and override the update() method to print out:
 - a. The Stock Symbol
 - b. The Stock Price
 - c. Either the price went up or down when it changed in the Stock Object
- 4) Create a driver program that will randomly change the stock value and show how your application prints out.

SUBMISSION:

- 1) Submit a doc,docx,pdf with a github link to your code.
- 2) Additionally add a printout of all source code and a printout of your output
